Botue-Mambare Nickel Exploration Project: Drilling Report August 2009

Dated: 10 August 2009

Further to the announcement made on 31 July 2009, Regency Mines plc ("the Company") the mining exploration and mineral investment company with interests in copper and nickel in Papua New Guinea ("PNG"), Western Australia, and Queensland, presents the first set of results from the Mambare Nickel Laterite Project, Papua New Guinea.

The results given cover all of the holes on lines 1 and 2 (21600N and 22000N respectively) and 7 of the 16 holes on line 3 (22400N). The lines are spaced 400m apart with drill holes at 200m intervals along each line. Lines 1-3 cover the area over the east slope and plateau above the NE-SW trending Aruma River. Data for lines 3-12 and 3 infill lines, covering areas further north and to the west of the river, are being received in stages over the coming weeks and will be announced later.

For line 1, the limonite horizon averages at 0.22%Ni and <0.03%Co over an average thickness of 5.24m. The underlying saprolite horizon averages 0.30%Ni and <0.03%Co over an average thickness of 3.10m. For line 2, 400m to the north, the limonite horizon averages at 0.57%Ni and <0.07%Co over a thickness of 7.86m and the saprolite horizon averages at 0.92%Ni and <0.05%Co over a thickness of 8.41m . The averages for line 3 are only based on 7 of the 16 holes drilled and thus are subject to change once the results from the remaining holes are
